

REAL Health Breakthroughs

from William Campbell Douglass II, M.D.

The cold truth about global warming

Try as you may, there's no escaping the doomsday warnings of the global warming activists. They've made it their mission to have you living in fear of all the dangers that come along with rising temperatures: heat strokes, floods, threats to the food supply, rise of infectious diseases, respiratory diseases, water and food-borne diseases, malaria...and on and on.

But if the media and Al Gore have you worried sick about global warming, take my advice: Ignore them!

Make no mistake: If global warming were a bonafide, honest-to-goodness threat, all of these fears could become a reality. But the truth is, the global warming threat is nothing more than a carefully planned scare tactic by greedy politicians looking to take over the world by filling you with fear and distracting you from the real threats to you and your loved ones. And at the root of it all is the United Nations. After all, the United Nations Intergovernmental Panel on Climate Change is one of the leaders in the effort against this non-existent threat.

That's why, as a man of science, I think there's a suspicious stink to the global warming issue.

Scientists follow the money

To be sure, there are legitimate scientists and researchers who ascribe to the theory. And I'm sure that climatologists are both stunned and excited that their discipline has actually become sexy and high-profile over the last 10 years. But no one bothers to point out that there are just as many legitimate scientists and researchers who think global warming is a bunch of hooey.

I often rail about the undue influence that money, business, and politics have on our health and our healthcare system. Other scientific disciplines are identical to medicine in this way—they don't operate in a vacuum.

Until this global warming hubbub, climatology wasn't considered a life-or-death issue the way medicine is. And just like doctors who are influenced by money from Big Pharma, so too are earth scientists and climatologists swayed by grant money and funded research.

Since global warming has become a divisive political minefield, there's big-time grant and research money being tossed about to help politicians (regardless of their stance on the issue) make their points. Which is why you need to take the entire global warming argument with a gigantic grain of salt.

An easier way to say it is this: the same climatologists and researchers who advocate global warming are often being paid to study it. If they want to continue their research—and they do—on the dime of government and private groups, you bet they're going to find evidence of global warming. Just like the cigarette company scientists for years always seemed to conclude that their

employers weren't making anyone sick. It's amazing what scientists will conclude when there's money involved.

The global cooling scare that never happened

I don't know if you remember this or not (I know I didn't), but a little over 30 years ago many scientists were stirring up fear of global freezing. On April 28, 1975, *Newsweek* printed an article called "The Cooling World." Here's a quote from the article: "The central fact is that after three quarters of a century of extraordinarily mild conditions, the earth's climate seems to be cooling down...If the climatic change is as profound as some of the pessimists fear, the resulting famines could be catastrophic."

So what ever came of the global cooling crisis? Nothing—because there was no crisis. The earth naturally experiences temperature fluctuations. So yes, the earth gets hotter and colder, but it's nothing to be alarmed about.

I was looking over a few of the global temperature graphs put together by climatologist Cliff Harris and meteorologist Randy Mann. They noted that in the last 4,500 years, there have been as many as 75 major temperature swings. They also pointed out what I find to be a very interesting tie between volcanic eruptions and the temperature of the earth: Whenever a major volcanic eruption occurs, the earth's temperature plummets.

Since 1991, we've had very little volcanic activity so, statistically, we're due for some. And you know what that means—temperatures will fall, and the global warmers will be out of business.

Disappearing polar ice caps make a mysterious comeback

You won't hear about this in any mainstream media, but there's new evidence that Al Gore's "rapidly disappearing" polar ice cap has made a remarkable comeback. According to statistics from the US National Oceanic and Atmospheric Administration, polar ice cap levels that had shriveled to just 4 million square kilometers by January of 2007 are now back up to their original level of 13 million square kilometers.

According to scientists, the northern hemisphere is in the midst of one of its coldest winters in decades, and snowfall has reached a record level that hasn't been seen since 1966. Last winter, central and southern China experienced crippling snows that brought much of that vast country to a halt for days on end. There was even snow in the Middle East, of all places.

To me, the concept of man-made climate change strains credulity. First, let's take a look at the "facts" upon which this supposed warming trend is based. How long would you say that mankind has been able to accurately record temperatures? A hundred years? A hundred and fifty at the most? If you see a TV weatherman talking about a "record" high temperature, was that "hottest day" ever, say, in July of 1712? Nope. The records usually don't go back much farther than the 1890s. So how can you draw a conclusion about a global warming trend based on a little over a century of accurately kept records, keeping in mind that a century represents little more than a nanosecond of geologic time? You can't.

I know that there are other factors involved—polar core samples, soil records, etc. But earth scientists are always telling us how cyclical the world is—how the earth has experienced several

ice ages where massive glaciers advanced and retreated over the course of several millennia. Knowing that, I find it just a little laughable to be getting worked up over doomsday scenarios that predict all of mankind to be living in a sweltering desert just 20 years from now unless we all stop putting our groceries in plastic bags.

What conspiring minds don't want you to know...

So what's my point in all of this? It's simple: Stop panicking over something you can't control, and start doing something about the REAL threats to your health that Big Government and Big Pharma don't want you to know, like:

- (1) Why you are paying an average \$3.13/gallon for pasteurized milk that has little calcium and could lead to cancer.
- (2) The FDA approved rat poison into your water.
- (3) The REAL cost of illegal immigration.
